

WHAT IS CLAIMED IS:

1. A light diffusion sheet comprising a light diffusion layer formed on a transparent substrate and containing a binder resin and resin particles that impart an uneven surface, wherein the light diffusion sheet has a total light transmission of 70.0% or more, haze of 80.0% or more, and a distinctness of transmission image of 25.0% or more.

2. The light diffusion sheet according to Claim 1, wherein internal haze of the light diffusion sheet caused by difference between refractive indices of the binder resin and resin particles is less than 40%.

3. The light diffusion sheet according to Claim 1, wherein difference between refractive indices of the binder resin and resin particles is within 0.05.
